TNO Information & Communication– Technology

Update Lobster & NERD

TNO | Knowledge for business

Agenda

- Lobster:
  - What is Lobster?
  - Status
- NERD:

Lobster

- Main goal:
  - To develop an advanced European infrastructure for passive network monitoring.
- 9 Partners:
  - ALCATEL, CESNET, ENDANCE, FORTH, FORTHNET, Vrije Universiteit Amsterdam, Terena, TNO, UNINETT
- Duration: oct 2004 – dec 2006

Possible Lobster Applications

- Accurate traffic characterisation for programs using dynamic ports
- Spread of zero-day worms
- European Internet measurement service
- End-to-end performance debugging
- Application performance measurement
- Trace DoS attacks
- Test platform for IPFIX attributes

Lobster

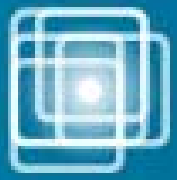
- High speed network monitoring (10Gbps)
- Use of Dedicated programmable hardware (fpga cards – DAG, SCAMPI)
- Monitoring application programming interface (MAPI)
- Multiple network sensor API (distributed MAPI)
- Cross domain monitoring
- Anonymisation framework
- Access control
- Demo applications

Lobster vs. Geant2

- Same ‘member’ community
- Lobster also tries to include commercial members (ISPs)
- Passive monitoring only
- Use same (passive) measurement data
- Equal infrastructure design (Lobster adapts from JRA1)
- Same security applications
- Not only security applications
- Lobster has shorter time span (2 years) (more pressed for demo apps)

Lobster status

- Requirements analysis – done!
  - Req. collection, acceptable use policy for fair sharing
- Monitoring infrastructure design – due Oct ’05
  - Anonymisation framework definition, Common access platform definition, first-tier encryption definition, integrated architecture definition
- Monitoring infrastructure realisation – due Apr ’06
  - Prototype
- Monitoring infrastructure deployment – due Jan ’06
  - LOBSTER applications, Monitoring infrastructure



NERD

Network Emergency Responder & Detector

- History
- How does it work?
  - real-time analysis
  - post analysis
  - web user interface
- Status
- Future
  - from application to framework
  - Integration in LOBSTER, Geant2.

History

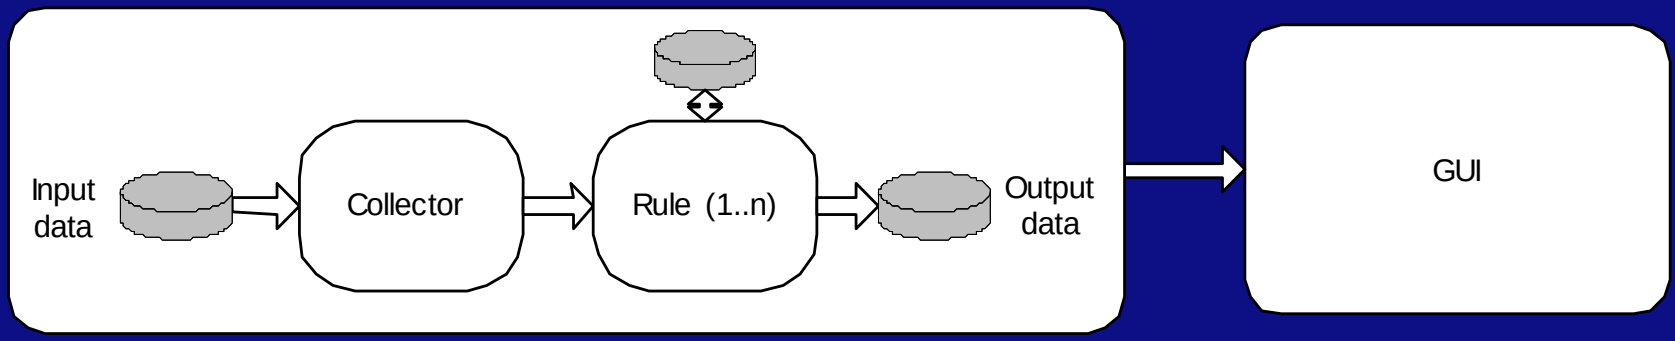
- 2002: SURFnet and TNO initiated a research project into DoS detection on the SURFnet network
- End of 2002: Prototype (NERD v0.1) finished, based on Caida's cflowd, flowtools, gnuplot and shell scripts.
- 2004: Design & development of NERD v0.5, removed third party tools by rewriting the daemon
- 2004: Design & development of NERD v1.0, bugfixes on daemon and new user interface
- 2004: Application to be used in Lobster
- 2005: potential security tool used in GN2/JRA2 (SURFnet)
- 2005 March 18: Open source release NERD (1.03beta)

- NERD – Network Emergency Responder & Detector

- Collects NetFlow
- A tool that detects DoS attacks
- raises Alarms
- flexible search through stored NetFlow data

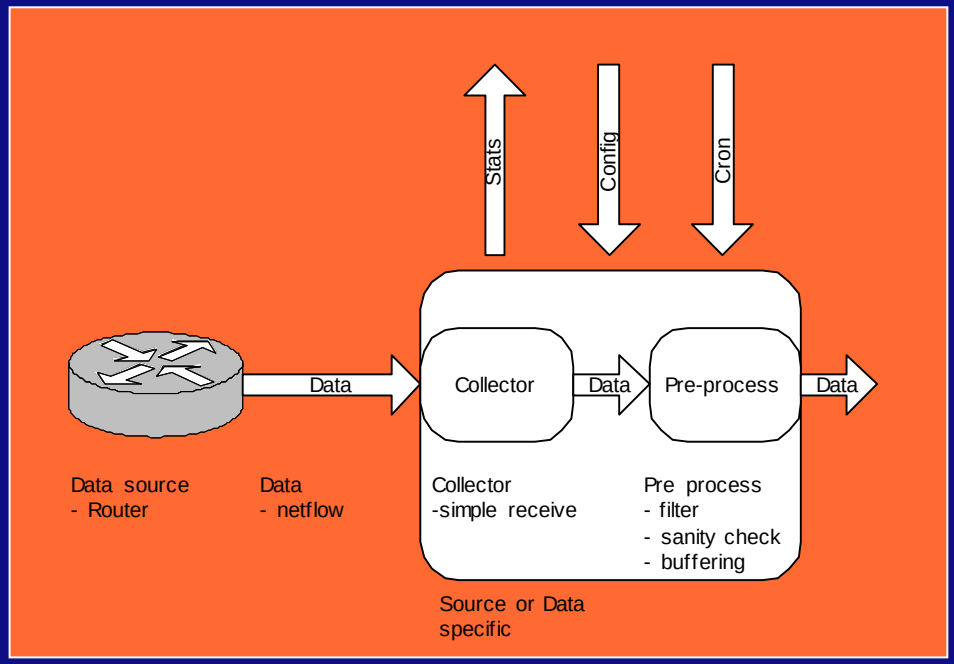
How does it work?

- Input data: NetFlow
- real-time analyse
  - Output: alarms in database
- post analysis
  - Output: flow-tools style data (text)
- web based GUI



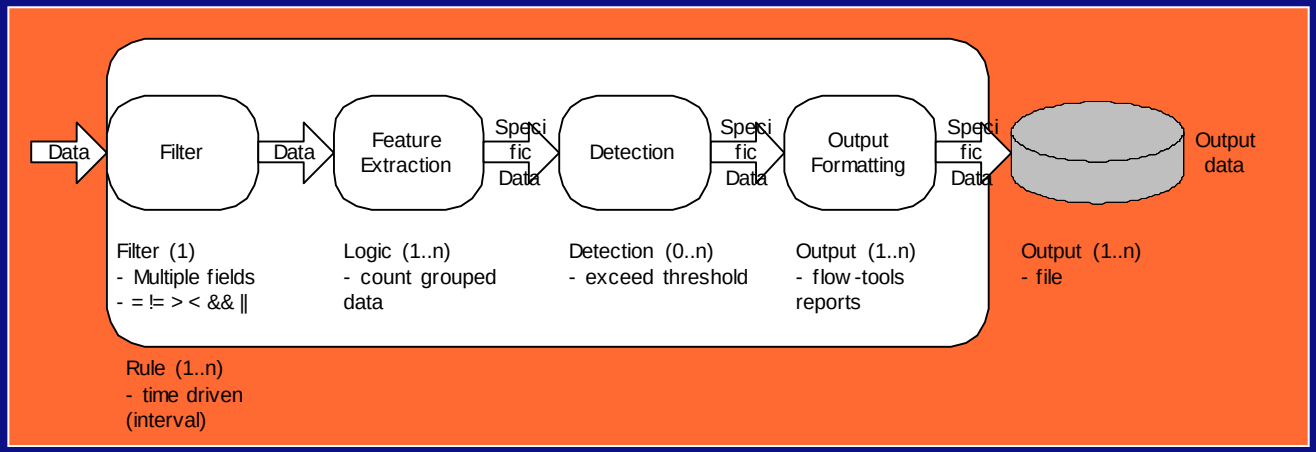
The collector

- Collector
  - simple UDP receiver (binds to multiple IP/port)
- Pre-processor
  - source specific functions (ex. filter double flows)
- Data stored on disk
  - for the post analysis
- Data kept in memory
  - for real-time analysis



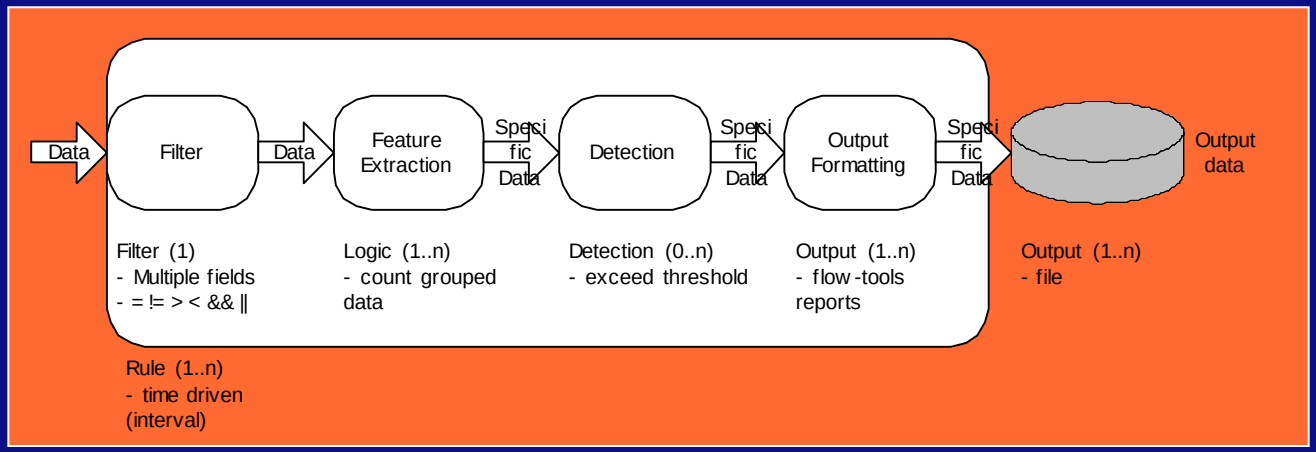
Real-time analysis

- Every x minutes the Rules (1..n) are executed
- Rule:
  - 1 filter (ex. src_addr = 123.0.0.0/16 and dst_port != 80)
  - 1..n clusters (cluster on dst_ip and count flows)
  - threshold (#flows > 1,000,000)
  - output formatting (alarm in database)



Post analysis

- Executed at users request
- Rule:
  - 1 filter (same as real-time analysis)
  - 1..n clusters (same as real-time analysis)
  - (no threshold)
  - output formatting (flow-tools like text files)



Configuration

- Stored in database
- Rule record = filter + cluster
  - making filters and clusters reusable
  - multi user prepared

Status

- Beta testers wanted!
- Short term todo list:
  - web-site/ subversion
  - documentation/ white paper
  - more intuitive interface
  - ipv6 & netflow v9 bug fixes
- Mid-long term (next year)
  - worm detection
  - 3D data representation (student)
  - Flexible data analysis (connection to ROOT/ MatLab etc.)
  - Integration into JRA1/ Lobster architecture
  - from application to framework…

From application to framework

- Other (data) sources
  - tcpdump, hardware cards, snort, firewall,
  - pcap/ raw format, alarms/ logging, XML,
- Combining different data
  - ex. fw or httpd log with network data for worm detection
- Other data output
  - graphs, alarms, top 10 list, XML reports, NetFlow
- Modular building bocks
  - basic function blocks
- Offer APIs for self-made feature extraction

Output data
Data source (1..n)
- router
- tcpdump
- hardware cards
- snort
- firewall
- the weather
- your special device
Data
- netflow
- snmp
- pcap files
- raw data
- XML
- your special data (or format)
Collector
- simple receive (udp)
- pull mechanism
- snmp client
- sftp/ssh
- you own special method (MAPI)
Pre process
- filter
- sanity check
- buffering
- reassembling
Collector
- Source or Data specific
Filter (1)
- Multiple fields
- = != > < && ||
Logic (1..n)
- has memory
- group data
- count
- math. Func.
- bpa
Detection (0..n)
- exceed threshold
- filter
Response (0..n)
- send email
- start ext. script
- create ACL
- tune sensor!
- tune own config!
- start analyse
Output (1..n)
- flow-tools reports
- RRD
- html
- XML (IDMEF)
- send as netflow
Output (1..n)
- database
- file
- udp packet
- xml
- email
- SMS
Rule (1..n)
- Multiple rules
- time driven (interval, abs. time)
- continuously
- every x of data
- best effort
